CLINICAL SERVICES PROGRAM

SAIC-Frederick

<http://web.ncifcrf.gov/research/csp/>

The Clinical Services Program was founded in 1981, and currently provides a full range of dedicated laboratory and clinical support. CSP laboratories perform sequential studies of immune function in patients with cancer, AIDS, chronic granulomatous disease (CGD), or chronic fatigue syndrome (CFS) during treatment with biological response modifiers or other potential anticancer or antiviral agents. Genechip services are a dedicated service to NIAID. For further information contact Dr. William Kopp at (301) 846-1707.

CRYOPRESERVATION

SAIC-Frederick

<http://web.ncifcrf.gov/rtp/lasp/intra/cryo/>

Cryopreservation and Assisted Reproduction Laboratory specializes in the banking of unique or valuable mouse strains by preserving their frozen germplasm in liquid nitrogen (-196 degree C). Alternative techniques, including the freezing of embryos, ovaries or sperm, enable most inbred, spontaneous mutant, or genetically engineered strains to be cryopreserved while maintaining genetic background and genotype.

FLOW CYTOMETRY CORE SUPPORT

NCI CCR Core

<http://web.ncifcrf.gov/research/flow-cyto-lab.asp>

Flow cytometry (FCM) is a unique experimental technology, which provides rapid, quantitative, multi-parametric, single cell analysis and separation. The mission of the flow cytometry core encompasses two related programs. First, basic research support is provided to members of the Frederick-CCR and, on a limited basis, to investigators elsewhere at NIH. The laboratory staff also participates in the development of flow cytometry applications and resources for use in immunological research. Resource development in the lab includes advances in instrumentation, reagents, methodology and computer hardware/software.

GENE CHIP PROCESSING

SAIC-Frederick

<http://web.ncifcrf.gov/research/csp/>

The Clinical Services Program was founded in 1981, and currently provides a full range of dedicated laboratory and clinical support. CSP laboratories perform sequential studies of immune function in patients with cancer, AIDS, chronic granulomatous disease (CGD), or chronic fatigue syndrome (CFS) during treatment with biological response modifiers or other potential anticancer or antiviral agents. Genechip services are a dedicated service to NIAID. For further information contact Dr. William Kopp at (301) 846-1707.

INTRAMURAL CYTOGENETICS

NCI CCR Core

<http://web.ncifcrf.gov/research/cytogenetics>

The Comparative Molecular Cytogenetic Core provides molecular cytogenetic support services to the NCI community. This facility aids in the assessment of structural and numerical genomic changes in cancer, pre-cancer, and cancer models. Currently service components of this core facility include, fluorescent in situ hybridization (FISH), spectral karyotyping (SKY), comparative genome hybridization (CGH), chromosome flow sorting, karyotyping, and sister chromatid exchange (SCE).

LABORATORY OF MOLECULAR TECHNOLOGY

SAIC-Frederick

<http://web.ncifcrf.gov/rtp/lmt/default.asp>

The Laboratory of Molecular Technology (LMT) is an integrated molecular biology laboratory focusing on high-throughput gene discovery and analysis including advanced sequencing, genetics, genomics, and proteomics technologies, together with associated bioinformatics and information management. The LMT is focused on genomics/proteomics technology development (including software development) and the application of these technologies to a variety of independent research programs. General access to these advanced technologies is provided to the NCI community through the LMT core service laboratories as described below.

PROTEIN EXPRESSION LABORATORY

SAIC-Frederick

<http://web.ncifcrf.gov/rtp/PEL/default.asp>

The Protein Expression Laboratory (PEL) strives to offer scientists within the National Cancer Institute the latest technologies in:

DNA amplification, gene cloning, expression clone construction, and expression optimization

Growth of microbial cells for protein expression

Growth of eukaryotic cells for protein expression

Protein purification

Cell-free protein expression

We consult with investigators to develop an integrated solution to their protein resource issues.

The PEL can execute the complete cloning, expression, scale-up, and purification process, or specific tasks within a larger project. The PEL serves scientists in other parts of the NIH on a time-available basis.
